

STORAGE CENTER™ DATA PROGRESSION™

Delivering On the Promise of Tiered Storage

Tiered storage solutions promise to help companies lower storage costs by storing less important data on less costly disks. But the hidden costs of data classification and the manual movement of data between tiers, along with the purchase and integration of multiple point products, quickly obliterates any potential savings. Without an intelligent and automated solution, the benefits of tiered storage are immediately outweighed by the resulting cost and management burden.

Automated Tiered Storage: Data Progression automatically classifies and migrates data to the optimum tier of storage, retaining frequently accessed data on high performance storage and storing infrequently accessed data on lower cost storage.

Compellent Saves Time and Money With Automated Tiered Storage

Data Progression reduces overall storage costs up to 74% by classifying and moving data at the block-level between tiers of storage based on frequency of access. This complete Automated Tiered Storage solution eliminates time consuming data classification and the repetitive, manual transferring of data between tiers.

Spend Less, Store More. Store inactive data on lower cost, high capacity drives, increasing the performance of Tier 1 resources while reducing overall costs.

Reduce Administrative Time. Eliminate time-consuming manual data classification and data movement by fully automating tiered storage processes.

Improve Business Continuity. Increase business continuity and performance by storing up to 8 times more Replays (snapshots) on lower cost, higher capacity drives, enabling more recovery points that can be kept online longer.

*The Industry's Only
SAN with Automated
Tiered Storage*

KEY BENEFITS

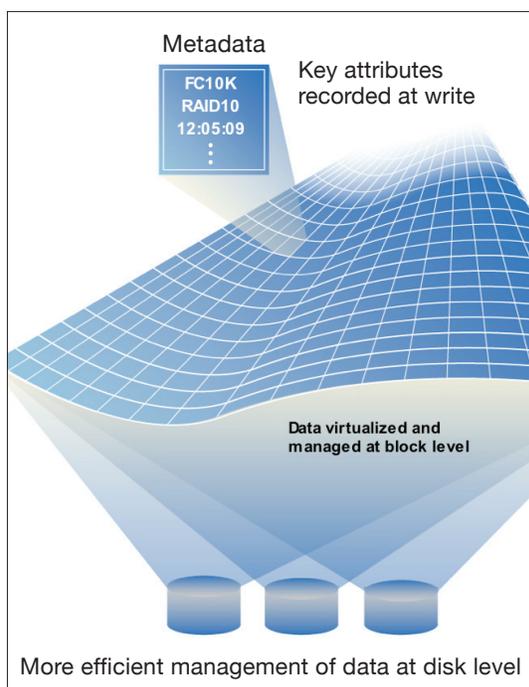

- » Reduce disk expenditures up to 74%
- » Eliminate manual data classification
- » Eliminate manual data movement between tiers
- » Improve business continuity – store up to 8 times more Replays (snapshots) at no additional cost
- » Dramatically increase performance by moving inactive data off Fibre Channel drives

Once created, data is rarely accessed after 30 to 90 days. In fact, storage analysts state that up to 80% of all stored data is inactive.

PRODUCT FEATURES

Dynamic Block Architecture Enables Intelligent Data Movement

Compellent's Dynamic Block Architecture records and tracks specific information about blocks of data, including time written, time accessed, frequency of access, associated volume, RAID level, and more. Data Progression utilizes all of this metadata, or "data about the data" to automatically migrate blocks of data to the optimum storage tier based on usage and performance, unlike traditional systems that move entire files.

- » Metadata accurately determines ideal data placement
- » Smart movement between tiers based on frequency of access
- » Intelligent block migration automatically migrates inactive portions of large files to lower-cost disk
- » Enable migration for a complete volume for specific periods of time
- » Volumes and files are stored across technology and RAID levels based on performance and redundancy attributes

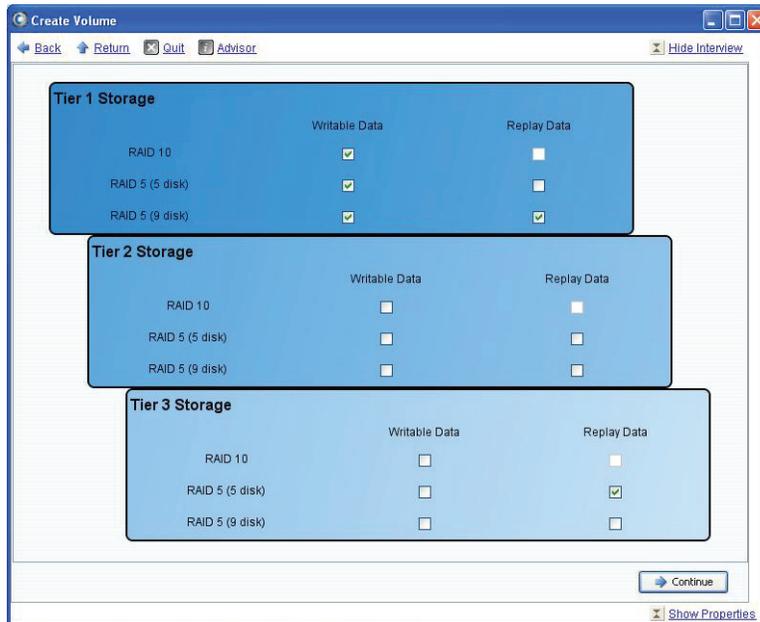

Dynamic Block Architecture: *Data Progression* utilizes the "metadata" to intelligently migrate data at the block-level, rather than moving entire files or volumes like traditional systems.

Multiple Storage Tiers Through Technology Independence

With Compellent's standards-based, modular architecture, storage tiers can utilize any technology and scale to any capacity. This independence allows you to mix and match disk drives, using the right blend for each tier. When new drive technologies become available, simply insert the drive into Storage Center without the hassle of downtime or the expense of an entirely new system.

- » Support for all existing and future drive technologies, drive capacities and spindle rates, in any combination
- » Add drives, enclosures and controllers online without downtime
- » Automatically adjusts tiers to accommodate new technologies without manual intervention

- › Storage tiers are defined by disk drive type and rotational speed, with additional sub-tiers further delineated by RAID levels 0, 5 and 10
- › Unlimited capacity growth within each tier

Multiple Storage Tiers: *Data Progression accommodates multiple storage tiers and sub-tiers based on disk drive type, RAID level and rotational speed.*

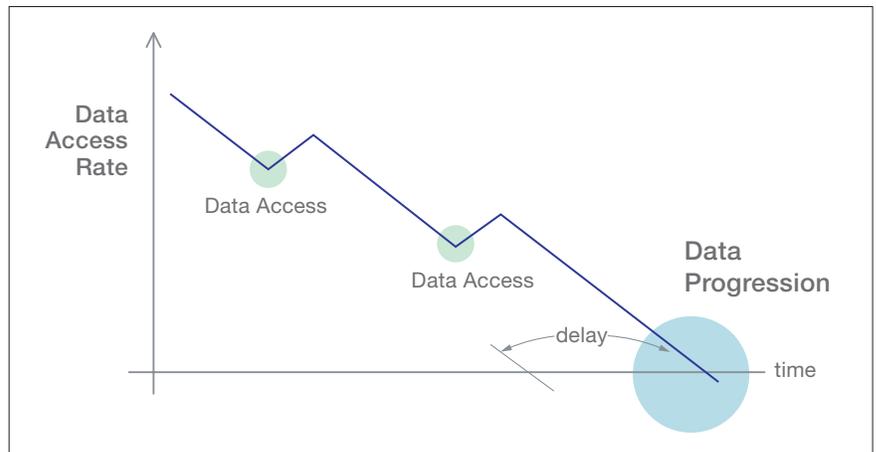

Automated Data Classification and Movement

Data Progression combines automated classification of data and block-level migration to allow organizations of all sizes to easily implement an Automated Tiered Storage solution in just minutes. By simplifying and automating the tiered storage process, companies can achieve the benefits of Information Lifecycle Management without the traditional cost and complexity. Data Progression obsoletes manual data classification and migration so IT departments can avoid the time consuming, company-wide classification efforts and the burden of purchasing, installing and managing multiple third-party hardware and software manual data movement products necessary with a typical tiered storage infrastructure.

- › Automatic tiering based on user-configurable classification policies including technology, performance, RAID level and redundancy
- › Fastest drives are automatically placed in a higher tier, slower drives in a lower tier
- › Auto-selects and stores the most active blocks on the highest-performance disk, while automatically placing less active blocks on lower-cost drives
- › Blocks of data move both up and down tiers of storage for optimal placement over time based on their frequency of access

Automated Tiered Storage cuts administrative time in half and reduces overall storage costs up to 74%.

Frequency of Access: *Data Progression* automatically migrates data at the block-level between storage tiers based on frequency of access, continually optimizing the placement performance of data over time based on its usage.

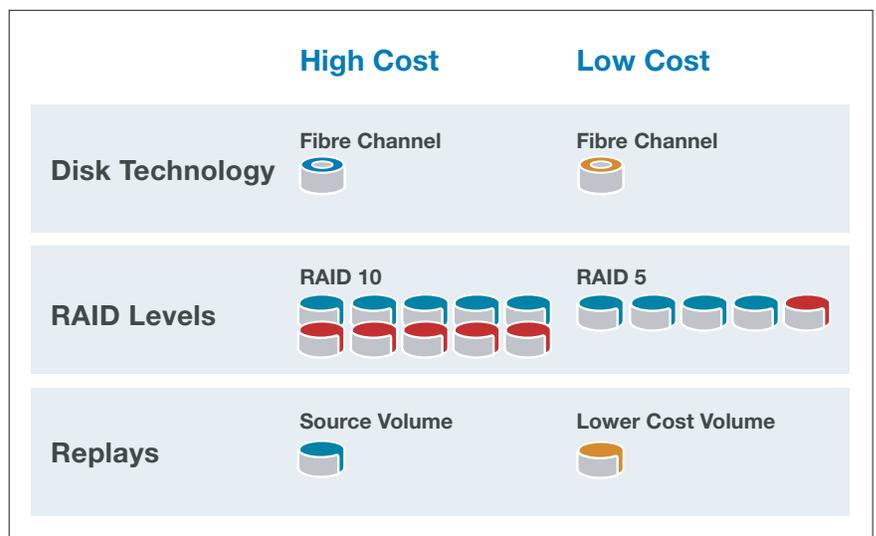

Unrivalled Compatibility, Flexibility and Manageability

Data Progression features unparalleled compatibility and ease of use. Compatible with any OS, drive type or application, Data Progression even works seamlessly with large databases. The intuitive wizard-base interface allows rapid set-up and management, with the ability to make changes at any time. You also can easily understand where the majority of your data is stored and determine over time how much additional disk of each type to purchase.

- » Supports multiple operating systems without costly server agents
- » Unlimited transitions between RAID levels and different tiers of storage, unlimited volume size, unlimited number of disks
- » Easy to use interface includes Wizard-based management, data movement notification and remote and local web based monitoring
- » Change classification policies at any time without downtime

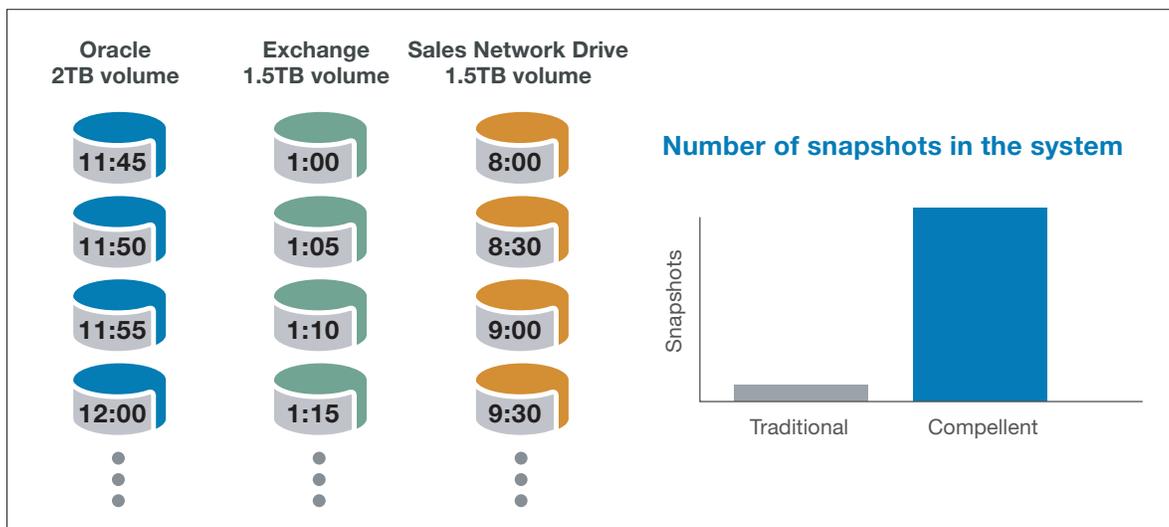

Cost Reduction Across All Technologies: *Data Progression* leverages different types of disk, RAID and protection levels within your tiered storage environment to reduce hard disk expenditures up to 74%.

Increased Data Availability, Recoverability and Performance

Storage Center supports unlimited space-efficient snapshots (called Replays) for reliable recovery. Data Progression automatically migrates these Replays to a less costly class of storage while maintaining immediate availability. This allows you to store up to 8x more Replays at no additional cost. Storing Replays on a lower tier also improves application performance and increases protection levels on frequently accessed storage without taking up high-performance disk space.

- › Create an unlimited number of Replays providing more granular recovery points
- › Store more Replays without impacting performance
- › Reduce number of back-ups required, use tape for its intended purpose as an archival medium
- › Each volume can be assigned its own Replay schedule based on the significance of the data stored
- › Automated Replays migration to lower cost, higher capacity drives lowers cost

Unlimited Recovery Points: *Data Progression automatically migrates snapshots to a less costly tier of storage, allowing you to maintain a higher number of recovery points with no cost or capacity impact.*

The Industry's Only SAN with Automated Tiered Storage

Storage Center's Data Progression is a complete hardware and software solution that fully automates tiered storage. Data Progression automatically classifies and migrates data to the optimum tier of storage based on usage allowing businesses to retain frequently accessed data on high performance storage and store infrequently accessed data on lower cost storage. By maintaining all data online and optimizing placement across multiple storage tiers, companies can purchase less storage overall and increase service levels.

ABOUT COMPELLENT

Compellent delivers affordable, modular storage solutions exclusively through business partners that provide companies of all sizes enterprise storage capabilities without big system costs or complexities. Designed by network storage and virtualization pioneers, Compellent enables any business to cut storage expenditures in half, recover from data hazards within minutes, scale to any capacity across any technology and easily manage its storage without adding staff.

DATA PROGRESSION SPECIFICATIONS

STORAGE TIERS

Storage Tiers Defined By	Disk Drive Type, RAID Level, Rotational Speed
RAID Level Support	RAID 0, 5, and 10
Disk Drive Support	Fibre Channel 15,000 RPM, Fibre Channel 10,000 RPM, Mid Tier Fibre Channel 7,000 RPM, SATA 7,200 RPM
Number of Available Tiers	9
Automated Tiering	Yes

DATA CLASSIFICATION AND MOVEMENT

Automated Data Movement	Yes, based on frequency of access
Automated Bi-directional Data Migration	Yes
Volumes Stored across Multiple RAID Levels and Tiers	Yes
Files Stored Across Multiple RAID Levels and Tiers	Yes
Intelligent Block-level Migration	Yes
Data Types Migrated	Writeable Data, Replay Data
Snapshots Migrated	Yes, automatic
File Level Support	Yes, with optional NAS Gateway
Additional Software Required for Data Classification and Movement	None

SCALING

Maximum System Size	Unlimited
Maximum Volume Size	Unlimited
Maximum Number of Disks	Unlimited
Maximum Number of Transitions between RAID Levels and Tiers of Storage	Unlimited

SERVER INTERFACE

Server Agents Required	No
Server Operating System Support	Microsoft Windows, Sun Solaris, HP-UX, Linux, IBM AIX, Novell NetWare, Apple, Tru64, VMware
